E-QUID: QUESTION / Genito-urinary

A suspect ovary

N. Peyron*, A. Coulon

Service d’imagerie médicale, Hospices civils de Lyon, Hôpital de la Croix-Rousse, 69004 Lyon, France

Observation

A 78-year-old female patient with no notable history was hospitalised for investigation of her altered general condition. An abdominopelvic ultrasound examination was performed to determine the aetiology. This showed a mixed 7 cm left ovarian mass comprised of a multilocular cystic part and a tissue part. There was also ascites. The right ovary was atrophic and fibrous. Laboratory tests were performed and found a CA125 level of 164 U/mL (N < 35 U/mL). A pelvic MRI was added to the series of examinations (Figs. 1 and 2).
