Methods.—Twenty-two patients were included and followed during epididymitis treatment. The chosen patients, besides epididymitis had a functional deficit with movement limitations of flexion. First group (12 patients) was treated with laser beam applied on painful areas. Ten patients in second group were treated with laser applied on acupuntural point SI5, Li4, Li10, L11, P3, Si8.

Results.—Analysing the VAS scale data it was estimated that high statistical significance in both groups is P < 0.001. While measuring ankle movement high statistical significance is achieved also in improvement of ankle flexion amplitude in both groups (Kruskal-Wallis test, P < 0.001). Better pain relief and increased flexion was detected in group II laser acupuncture application (Mann-Whitney P < 0.05).

Conclusion.—Analysis has clearly shown positive impact of laser therapy in pain relief, and ankle movement amplitude, with better results of laser applications on acupuntural points during treatment.

P113-e Effect of kinesiotaping in patients with chronic lumbar disc herniation: Randomized-controlled, double-blind study

B. Yavuz Keles, E. Yilmaz Yalcinkaya

Alteor, Crolles, France

Background: Kinesio-Taping (KT) is a promising treatment for the control of low back pain.

Aim: To investigate the effects of KinesioTape (KT) on patients with chronic low back pain due to lumbar disc herniation.

Methods: 22 patients with chronic low back pain, aged between 25–45 years were randomized to the KT (n=22) or sham taping (n=9) group. All the patients were prescribed home exercises for lumbar disc herniation; tape was used 3 times, once a week either with KT or sham tape. Pain was evaluated at the beginning, 3rd, 6th and 12th weeks by a blinded physiatrist. Visual Analog Scale (VAS), Oswestry Disability Index (ODI) and number of paracetamol tablets taken were used for evaluation.

Results: Mean age was 37.3 ± 6.6 years. The demographic and clinical features of the two groups were similar at the beginning. There was significant improvement at all the parameters at the 3rd week in both groups; but the improvement continued to 12th week (HAQ and VAS) in the taping group only. The patients in the sham group needed more analgesic after 3rd week.

Conclusion: Kinesiotaping is effective in increasing function, decreasing pain, need for analgesic medication in patients with chronic lumbar disc herniation.

P114-e Lumbar disc prosthesis and physical and sports activities: A monocentric study with 83 patients

G. Muffa, M.E. Isner-Horobeti, C. Muhl, J. Masat, J.P. Steib, P. Vautravers, J. Lecocq

Institut Universitaire de Réadaptation Clémenceau, Marlenheim, France

Service de Chirurgie du Rachis, Hôpitaux Universitaires de Strasbourg, Strasbourg, France

Background: The aim of this study was to measure the impact of different lumbar orthosis (LO) designs for preventing the occurrence of this fear-avoidance strategy. Twelve

Methods: Eighty-three patients who had disc prosthesis surgery for lumbar disc degeneration between 2003 and 2008. The 83 patients with disc prosthesis surgery were distributed into three groups, according to their level of physical and sports activities: intensive physical and sports activity, regular physical and sports activity, and settled way of life.

Results: After a mean follow-up of 36 months, the results in terms of pain, quality of life and delay before resuming work are all better for subjects with intensive physical and sports activity, highlighting the beneficial role of physical and sports activity, on the effects of a surgical treatment by lumbar disc prosthesis.

P115-e Clinical effects of different therapeutic models in tendinitis supraspinatus

V. Bajec, S. Janic, G. Radunovic, L. Konstantinovic, B. Stojic

Institut of Rheumatology, Belgrade, Serbia

Clinik of Rehabilitation, Belgrade, Serbia

Background: In patients with tendinitis supraspinatus, lasertherapy, Diprofos® and acupuncture are highly effective for functional status improving. Clinical effects of different therapies in tendinitis supraspinatus Leading pathological cause is tendon inflammation followed by hypervascularisation and oedema. Main clinical manifestations are pain and impaired function.

Objectives: To establish therapeutic effects of three different therapeutic models: low level lasertherapy (LLT), local corticosteroid infiltration (LCI) and acupuncture (A), on subjective symptoms and objective signs, in painful shoulder syndrome caused by tendinitis supraspinatus. To compare effects of the three different therapeutic models.

Methods: Randomised prospective clinical study included 36 patients with chronic shoulder pain, comparable with regard to sex, age, concomitant diseases. Diagnosis was made with regard to clinical, radiological, ultrasonographic examination. Patients were divided into three therapeutic groups (12 patients). I-group: treated with lasertherapy. Midlaser, Irradia, 904 nm, 5000 Hz. Ten points located in inflammatory region, daily dose of 10 J/cm² X days. II-group: treated with LCI/Betamethasonium Diprofos® 1 mL/in inflammatory region. III-group: treated with acupuncture (LI4,G38,UB57,LI11,L15,L16, 4 pain-tender-points), NoX. All of the patients were given pendular free-swinging exercises. Measured parameters were: local functional status-measured with Constant Murley functional scale. Wilcoxon test and Kruskall-Wallis test was used for statistical analysis.

Results: Highly significant statistical difference was fortified before and after the treatment in every of the three therapeutic groups (Wilcoxon, P < 0.001). There was no significant difference among therapeutic groups (Kruskal-Wallis, P < 0.05).

Conclusion: In patients with tendinitis supraspinatus, lasertherapy, Diprofos® and acupuncture are highly effective for functional status improving.

P116-e Effects of lumbar orthosis on postural control strategies in subacute low back pain

F. Munoz, J.F. Salmochi, P. Rougier

ALTEOR, CROLLES, France

Clinique du Parc, Lyon, France

Background: Some low back pain (LBP) patients demonstrate a rigid postural control strategy induced by a persistent and excessive muscular co-activation of the trunk. The aim of this study was to measure the impact of different lumbar orthosis (LO)
