William Lawrence Bragg was an Australian–British physicist and crystallographer who was defined by a high code of honor based on sacrifice and work. William Lawrence Bragg, who won the Nobel Prize in Physics in 1915, is most famous for his law on the diffraction of X-rays by crystals, a theory that makes it possible to calculate the positions for all dispositions of a crystal. He presented his theory to the Cambridge Philosophical Society on 11th November 1912. William Lawrence Bragg, with his encyclopedic discovery, discovered that sodium chloride crystals are not made of molecules at all, but are rather patterns of sodium and chloride ions. This early experiment served as the foundation for the science of X-ray crystallography. Because of William Lawrence Bragg, crystallography became an important tool for chemists and mineralogists. Bragg’s Law is fundamental to the determination of the molecular structure of materials. Bragg’s work has had an enormous impact across modern science and its applications, in medicine, physics, chemistry and the biological sciences, including determining the structures of proteins and the DNA genetic structure. Their techniques are routinely used in many industries, including the development of new drugs and chemicals, and in the mineral industry.

This year, the French Academy of Sciences is celebrating its 350th anniversary, which is the perfect occasion to remember William Lawrence Bragg, as he was also a member of the French Academy of Sciences.

The life of Bragg: O sancta simplicitas!

In the year in which Benz invented the accelerator (to allow drivers to control speed), a Benz automobile was started with a spark ignition, Brantly launched wireless telegraphy, and the central automatic telephone was invented, William Lawrence Bragg was born. When William Lawrence Bragg was born, a great artist, Vincent Van Gogh, disappeared from the Earth. Life and death, the Sky and the Earth! Pretium doloris: the tragedy of Van Gogh’s death and the joy of Bragg’s birth. William Lawrence Bragg was born five years before Röntgen discovered X-rays (1895).

William Lawrence Bragg, the eldest child of William Henry and Gwendoline, was born in Adelaide, South Australia, on 31 March 1890. He had a brother and a sister. His father was the Professor of Mathematics and Physics at the University of Adelaide. He received his early education at St. Peter’s College, located at his birthplace. He was a very able student, and from the age of 11, he studied at this college. He was an impressionable boy and showed an early interest in science. In 1904, at age 15, William Lawrence Bragg entered Adelaide University to study mathematics, chemistry, and physics. He graduated in 1908, at the age of 18. In the same year, his father accepted the Chair of Physics at Leeds University and brought the family back to England.

William Lawrence Bragg entered Trinity College, Cambridge, and received a major scholarship in mathematics. After initially excelling in mathematics, he transferred to the physics course in the later years of his studies. In Trinity College, Cambridge, he obtained first class honors in the Natural Science Tripos in 1912. After finishing his studies, he stayed on to work at the Cavendish Laboratory. From 1912 to 1914, he worked with his father, and in 1914, he was appointed as a fellow and lecturer in Natural Sciences at Trinity College and began his research under the supervision of Thomson. The First World War interrupted his work. Bragg was commissioned as a 2nd Lieutenant in the Leicester Royal Horse Artillery, and in August 1915, he began working on sound-ranging methods for locating enemy’s guns. In the autumn of 1915, Bragg’s brother Robert was killed in the War. He supervised the work on enemy gun location, between 1917 and 1919, rising to the rank of Major.

In 1919, William Lawrence Bragg was appointed to succeed Rutherford at Manchester University, where he held the Langworthy Chair, which was, at that time, arguably the second most important position in Britain after the Cambridge Chair, where Rutherford succeeded Thomson. He held this post until 1937. However, he was elected the Fellow of the Royal Society in 1921. In 1937, Bragg moved to the National Physical Laboratory as a director for a year, but after Rutherford’s premature death, he was invited to Cambridge as the Cavendish Professor of Experimental Physics. He was
the Cavendish Professor of Experimental Physics, Cambridge, from 1938 to 1953. He moved to the Royal Institution, London, as the Fullerian Professor of Chemistry between 1954 and 1966 and as director of the Davy—Faraday Research Laboratory—a post once held by his father. In 1941, he was knighted as ‘Sir Lawrence’ and spent 6 months as a Scientific Liaison Officer in Canada. Between 1939 and 1943, he was the President of the Institute of Physics. He was the Emeritus Professor from 1966 to 1971.

William Lawrence Bragg was awarded the Barnard Medal in 1914, the Nobel Prize in Physics for his work on X-ray crystallography in 1915, the Hughes Medal of the Royal Society in 1931, the Royal Medal of the same Society in 1946, and the Roebling Medal of the Mineral Society of America in 1948. He was awarded the Copley Medal by the Royal Society for contributions to the development of structural determination methods by X-ray diffraction in 1966 and was appointed to the Order of the Companion of Honor in 1967.

He was the Chairman of the Frequency Advisory Committee from 1958 to 1960. Knighted in 1941, Sir Lawrence held the degrees of M.A. (Cambridge), Honorary D.Sc. (Dublin, Leeds, Manchester, Lisbon, Paris, Brussels, Liege, and Durham), honorary Ph.D. (Cologne), and honorary LLD. (St. Andrews). He received many honorary fellowships and was an honorary or foreign member of the French, American, Chinese, Swedish, Dutch, and Belgian Scientific Academies.

In 1921, he married the charming Alice Hopkinson, a historian from Cambridge, with whom he had four children: two sons (Stephen and David) and two daughters (Margaret and Patience). Stephen became the third generation of Bragg’s to study mathematics at Cambridge University.

**Research activities or dignitas dignatum**

William Lawrence Bragg started his first important work as a result of the claim made in 1912 by Friedrich, Knipping, and Laue that they had observed the diffraction of X-rays by a crystal. Over the summer of 1912, William Lawrence Bragg had many conversations about X-rays and crystals with his father and began investigating von Laue X-ray patterns. Laue used a crystal to create a diffraction pattern, proving that X-rays were transverse (crosswise) electromagnetic waves, similar to light. William Lawrence Bragg, believing that Laue’s explanation was incorrect in detail, carried out a series of ingenious, original experiments that led to a sudden and brilliant inspiration that ultimately solved the riddle. William Lawrence Bragg suggested that ZnS should be seen as face-centered cubic rather than as simple cubic. He was then brilliant inspiration that ultimately solved the riddle. William Lawrence Bragg suggested that ZnS should be seen as face-centered cubic rather than as simple cubic. He was then able to show that, as a result, the diffraction pattern was entirely explicable as having arisen from the diffraction of white X-radiation through a three-dimensional grating. Laue had calculated the conditions for the diffracted intensity maxima for the simple cubic system, where the incident beam was parallel to one side of the cell. William Lawrence Bragg discovered how to use X-rays to determine the molecular structure of crystals. William Lawrence Bragg also postulated Bragg's law, \( n \lambda = 2 d \sin \theta \), the equation that links the wavelength of X-rays to the distance between two crystal planes and the angle of incidence. William Lawrence Bragg identified that X-rays were explained, in part, as waves and also as particles, and from this insight, he developed Bragg's law. The Bragg’s showed that crystals of substances such as sodium chloride contain no actual NaCl molecules, but are simply sodium and chloride ions arranged with geometric regularity. This discovery revolutionized theoretical chemistry. William Lawrence Bragg analyzed the arrangements of atoms within the crystals, while his father designed an X-ray spectrometer and further explored X-ray radiation. Together, they created the new science of X-ray crystallography. In the case of KCl, the atoms are of approximately equal scattering power, which is reflected in the simple cubic lattice to which both, as it were, contribute. This is not the case for KBr, where the lattice is defined by the heavier Br atom. NaCl is an intermediate case, reflecting the greater but not predominant scattering power of the Cl atom. In July 1913, the Bragg’s published the structure of diamond, showing the carbon atoms to be tetrahedral. William Lawrence Bragg showed that the further quantitative study of intensities could be used to determine the position of those atoms, which are not fixed with reference to symmetry considerations. In this paper, he solved the structures of FeS and CaCO₃, both with a single such parameter and the first of such structures to be solved. This work jointly earned William Lawrence Bragg and his father the Nobel Prize for Physics in 1915, “for their services in the analysis of crystal structure by means of X-rays”. At twenty-five, William Lawrence Bragg was the youngest ever Nobel Laureate.

After the War, the close collaboration between father and son ended, but it was natural that their work would continue to overlap. To prevent a casus belli between father and son, they decided to divide up the available work and agreed to stick to separate areas of X-ray crystallography. William Lawrence Bragg was to focus on inorganic compounds, metals and silicates, while his father was to focus on organic compounds.

In 1948, Bragg became interested in the structure of proteins. After the war, William Lawrence Bragg established a unit for the study of the molecular structure of biological systems at the Cavendish Laboratory, with funding from the Medical Research Council. In 1953, Francis Crick and James Watson determined the double helical structure of DNA and were awarded the Nobel Prize in Physiology or Medicine in 1962. Max Perutz and John Kendrew, working at both the Royal Institution and the Cavendish Laboratory, determined the structures of hemoglobin and myoglobin, for which they won the Nobel Prize in Chemistry in 1962. Working with William Lawrence Bragg during the 1960s at the Royal Institution, David Phillips determined the structure of an enzyme, lysozyme, for the first time.

In his career he published 257 papers and 13 books, many of which were translated into several languages, none more so than the write-up of his Royal Institution Christmas Lectures entitled “Electricity” in 1936, which was also published in Swedish (1937), Polish (1939), Czech (1940), Hungarian (1948), Finnish (1950), German (1951), Japanese (1951), and Italian (1953). Even after his retirement as a Director there in 1966, he composed many fine popular articles such as “The Art of Talking about Science”, “The Spirit of Science”, and “What Makes a Scientist”, as well as his famous foreword to The Double Helix by Watson. In it he said that Watson “writes with a Pepys-like frankness. Those who figure in the book must read it in a very forgiving spirit.”

Please cite this article in press as: I. Fechete, William Lawrence Bragg: Forerunner to modern crystallography, Comptes Rendus Chimie (2016) 1–7
After the Second World War he helped organize the International Union of Crystallography, and was its inaugural President.

His lifelong interests were the popularization and teaching of science, including the history of science. Among his hobbies, he was interested in astronomy, collecting shells, and rose gardening.

At his elegant retirement in September of 1966, Bragg transferred power to his successor George Porter at the Royal Institution. Bragg died at a hospital near his home at Waldringfield five years later, on July 1, 1971.

William Lawrence Bragg remains associated with the entire history and development of X-ray crystallography. The successful study of silicates not only revolutionized the basis of mineralogy but also was used by Pauling in his work on structural chemistry. The impact of the Bragg’s work has been far reaching. Because of William Lawrence Bragg, crystallography became an important tool for chemists and mineralogists.

Petit, Jean-Louis (13 March 1674–20 April 1750), French anatomist.
Richelieu, Louis-François-Armand Duplessis de (13 March 1696–8 August 1788), French diplomat.
Bonnet, Charles (13 March 1720–20 May 1793), Swiss naturalist.
Priestley, Joseph (13 (24) March 1733–6 April 1804), British chemist.
Littrow, Joseph Johann von (13 March 1781–30 November 1840), Austrian astronomer.
Boussinesq, Joseph Valentin (13 March 1842–19 February 1929), French mathematician and physicist.
Drach, Jules (13 March 1871–7 March 1949), French mathematician.
Tate, John Torrence Jr. (13 March 1925), American mathematician.
Villain, Jacques (13 March 1934), French physicist.
Fontaine, Jean-Marc (13 March 1944), French mathematician.

14

Musschenbroek, Petrus (14 March 1692–20 March 1668), Dutch physicist.
Deschamps, Joseph-François-Louis (14 March 1740–8 December 1824), French medical doctor.
Leudet, Théodore-Emile (14 March 1825–5 March 1887), French medical doctor.
Schiaparelli, Giovanni Virginio (14 March 1835–4 July 1910), Italian astronomer.
Andre, Charles Louis François (14 March 1842–6 June 1912), French astronomer.
Einstein, Albert (14 March 1879–18 April 1955), Swiss-American scientist of German origin and Nobel laureate (1921).

15

La Caille, Nicolas-Louis de (15 March 1713–21 March 1762), French astronomer.
Borde, Christian (15 March 1943), French physicist.

16

Richet, Didier Dominique Alfred (16 March 1816–30 December 1891), French anatomist.
Mittag-Leffler, Magnus Gosta (16 March 1846–7 July 1927), Swedish mathematician.
Vigier, Antoine François Camille (16 March 1850–17 February 1930), French lawyer.
Boudet, Alain-Michel (16 March 1940), French biologist.

17

Marchetti, Alessandro (17 March 1633–6 September 1714), Italian mathematician.
Templeman, Peter (17 (21) March 1679, 1713), English philosopher.
Odier, Louis (17 March 1748–13 April 1817), Swiss medical doctor.
Simmons, Samuel Foard (17 March 1750–23 April 1813), British physiologist.
Costaz, Louis de (17 March 1767–15 February 1842), French scientist.
Maclear, Sir Thomas (17 March 1794–14 July 1879), Irish-South African astronomer.

18

La Hire, Philippe de (18 March 1640–21 April 1718), French mathematician and astronomer.
Berthoud, Ferdinand (18 March 1727–20 June 1807), French scientist.
Steiner, Jacob (18 March 1796–1 April 1863), Swiss mathematician.
Rose, Gustav (18 March 1798–15 July 1873), German mineralogist.
Gay, Claude (18 March 1800–29 November 1873), French botanist.
Carleson, Lennart Axel Edvard (18 March 1928), Swedish mathematician.

19

Soares de Barros e Vasconcellos, José Joaquim (19 March 1721–2 November 1793), Portuguese scientist.
Frank, Johann Peter (19 March 1743–24 April 1821), German physicist.
Moreau de Jonnes, Alexandre (19 March 1778–28 March 1870), French military and official.
Burdin, Claude (19 March 1788–12 November 1833), French engineer.
Bonnet, Amedée (19 March 1809–2 December 1858), French medical doctor.
Abria, Jeremie Joseph Benoit (19 March 1811–4 April 1892), French physicist.
Livingstone, David (19 March 1813–1 May 1873), French medical doctor.
Delannoy, Émile Florent (19 March 1892–26 June 1971), French medical doctor.
Flahaut, Jean (19 March 1922–5 October 2015), French chemist and pharmacist.

20

Chomel, Antoine (20 March 1668–8 May 1702), Dutch astronomer.
Van Marum, Martijn (20 March 1750–26 December 1837), Dutch scientist.
Lesson, Rene-Primevere (20 March 1794–28 April 1849), French zoologist.
Verneouj, Robert de (20 March 1890–14 October 1992), French medical doctor.
Gehring, Walter Jakob (20 March 1939–29 May 2014), Swiss biologist.

Bidloo, Govert (21 March 1649–30 April 1713), Dutch anatomist and physicien.
Deyeuws, Nicolas (21 March 1745–27 April 1837), French chemist.
Fourier, Jean Joseph (21 March 1768–16 May 1830), French mathematician and physicien.
Planchnon, Jules-Emile (21 March 1823–1 April 1888), French botanist.
Birkhoff, George David (21 March 1884–12 November 1944), American mathematician.
Costas, Pascale (21 March 1948), French scientist.

Sedgwick, Adam (22 March 1785–27 January 1873), British geologist.
Didion, Isidore (22 March 1798–4 July 1878), French mathematician.
Argelander, Friedrich Wilhelm August (22 March 1799–17 February 1875), German astronomer.
Bussy, Marie Anne Louis de (22 March 1822–4 April 1903), French engineer.
Fowler, Alfred (22 March 1868–4 June 1940), English astronomer.
Millikan, Robert Andrews (22 March 1868–20 December 1953), American physicist and Nobel laureate (1923).

Monti, Filippo Maria (23 March 1675–17 January 1754), Italian cardinal.
Chappe d’Auteroche, Jean-Baptiste (23 March 1728–1 August 1769), French astronomer.
Laplace, Pierre-Simon de (23 March 1749–5 March 1827), French mathematician and physicien.
Bertin, Louis Emile (23 March 1840–22 October 1924), French naval chemist.
Sergent, Etienne Louis Marie Edmond (23 March 1876–20 August 1969), French physiologist.
Staudinger, Hermann (23 March 1881–8 September 1965), German chemist.
Vapereau, Alexandre Edmond (23 March 1903–21 June 1992), French physiologist.
Bovet, Daniel (23 March 1907–8 April 1992), Swiss-Italian pharmacologist and Nobel laureate (1957).
Daranton, Henri (23 March 1926–9 April 2015), French agronomist.
Postaire, Eric (23 March 1957), French physician.

Sauveur, Joseph (24 March 1653–9 July 1716), French physiologist and mathematician.
Lafosse, Philippe Estienne (24 March 1738–13 May 1820), French veterinarian.
Liouville, Joseph (24 March 1809–8 September 1882), French mathematician.
Tannery, Jules (24 March 1848–11 November 1910), French mathematician.
Morse, Marston Harold (24 March 1892–22 June 1977), American mathematician.
Butenandt, Adolf (24 March 1903–18 January 1995), German biochemist and Nobel laureate (1939).
Genzel, Reinhard (24 March 1952), German astronomer.

Degen, Ernst Heinrich Carl von (25 March 1800–15 February 1889), German geologist.
Godron, Dominique Alexandre (25 March 1807–16 August 1880), French botanist and doctor.
Engler, Heinrich Gustav Adolph (25 March 1844–10 October 1930), German botanist.
Berloty, Camille Marie Antoine Bonaventure (25 March 1856–10 October 1934), French astronomer.
Leclerc du Sablon, Albert Mathieu (25 March 1859–18 March 1944), French botanist.
Ocagne, Philibert Maurice de (25 March 1862–23 September 1918), French mathematician.
Flexner, Simon (25 March 1863–2 May 1946), American scientist.
Weiss, Pierre (25 March 1865–24 October 1940), French physiologist.
Tubiana, Maurice (25 March 1920–24 September 2013), French biologist of Algerian origin.

Hartsoeker, Nicolaas (26 March 1636–10 December 1725), Dutch mathematician and physicien.
Rumford, Benjamin Thompson de (26 March 1753–21 August 1814), British-American physiologist.
Cayeux, Lucien (26 March 1864–1 November 1944), French geologist.
Theiler, Sir Arnold (26 March 1867–24 July 1936), Swiss veterinarian.

Brisseau de Mirbel, Charles François (27 March 1776–12 September 1854), French botanist.
Hittorf, Johann Wilhelm (27 March 1824–28 November 1914), German physiologist.
Landouzy, Theophile Joseph Louis (27 March 1845–10 May 1917), French medical doctor.
Spitz, Erich (27 March 1931), French scientist.

Ruesch, Frederic (28 March 1638–22 February 1731), Dutch botanist.
Seebeck, Thomas Johann (28 March 1770–10 December 1831), Estonian-German physicien.
Heymans, Cornelle Jean-François (28 March 1892–17 July 1968), Belgian physiologist and Nobel laureate (1938).
Maier-Leibnitz, Heinz Hermann (28 March 1911–22 December 2000), German physiologist.
Jacob, Maurice (28 March 1933–2 May 2007), French physiologist.

Vacher, Gilles (29 March 1693–18 October 1760), French medical doctor.
Béal, Auguste (29 March 1859–2 February 1941), French chemist.
Levi-Civita, Tullio (29 March 1873–29 December 1941), Italian mathematician.
Spencer-Jones, Harold (29 March 1890–3 November 1960), British astronomer.
Dejours, Pierre (29 March 1922–10 January 2009), French medical doctor.

Vidal, Jacques (30 March 1847–2 January 1891), French astronomer.
Bunsen, Robert Wilhelm (30 (31) March 1811–16 August 1899), German chemist.
Favre, Jean Alphonse (30 March 1815–11 July 1890), Swiss geologist.

31

Chenaud, Jacques (31 March 1654–5 February 1741), Swiss medical doctor.

Spielmann, Jacob-Reinbold (31 March 1722–9 September 1783), French scientist.

Bezout, Etienne (31 March 1730–27 September 1783), French mathematician.

Cordier, Pierre Louis Antoine (31 March 1777–30 March 1861), French mineralogist and geologist.

Temminck, Cenraad Jacobus (31 March 1778–30 January 1858), Dutch scientist.

Vicat, Louis Joseph (31 March 1786–10 April 1861), French engineer.

Pope, William Jackson (31 March 1870–17 October 1939), English chemist.

Bragg, William Lawrence (31 March 1890–1 July 1971), Australian English physicist and Nobel laureate (1915).

Allégre, Claude Jean (31 March 1937), French geochemist.
